

PATIENT TREATMENT & RECOVERY ANALYSIS

Executive Healthcare Analytics Report

Olufunmilola Lanade

Healthcare Data Analyst | Excel | Data Storytelling

Executive Summary

This analysis evaluates patient recovery outcomes across departments, treatment types, and demographics. Key findings highlight performance gaps in Cardiology, cost inefficiencies in surgical treatments, and higher risk among younger patient groups. Strategic improvements can enhance both patient outcomes and operational efficiency.

Dashboard Overview

Cardiology underperformance indicates need for targeted improvement strategies.

Treatment Effectiveness

Surgery yields highest outcomes but increases cost burden.

Cost Optimisation

Patient Distribution By Treatment Cost

Low-cost treatments achieve similar recovery, presenting savings opportunity.

Demographic Risk Analysis

Patient distribution by Gender

Average Recovery Score by Age Group

Teenagers show lowest recovery performance, requiring targeted care.

Business Impact

Cost Reduction: Optimise high-cost treatments.

Patient Safety: Reduce delays and improve outcomes.

Efficiency: Standardise clinical practices.

Strategy: Use analytics to guide decision-making.

Strategic Recommendations

- Improve Cardiology clinical protocols
- Optimise surgical resource utilisation
- Implement targeted youth care programs
- Standardise physician best practices
